Calculator how to document

Asmaa Ramadan Khamis | 18015029

To get started:

- Open the html file.
- or open the backend and frontend projects in vs code and run backendApplication.java class.
- Then open the html file.

How to:

1- Write first operand

2- Choose the operation
   - In case of single operand operations you don't need to press equal button the result appears immediately after clicking the single operand operation.
   - In case of two operands operations you click the operation then you write the second operand then you click the equal button

3- You can do another operation on the result (you consider the result your first operand in that case)

4- If you choose an operation then you choose another operation the first operation is discarded and it's replaced by the last operation you clicked.

5- After getting an math error message (" E") pressing any number will clear all previous data and that new number will be your first operand.

6- If you press backspace button when the result is being displayed the calculator resets.

7- Pressing equal or any operation button after getting math error will do nothing so to start again you can either click (C or CE button) or choose a new number.

8- .5 is treated as 0.5 it does not cause an error.
